

### **DHP Half Pipe Splash Tightness Confirmation**

The DHP Half pipes have been designed for splash water tightness only.

No pressure tightness as a product property is approved. If pressure tightness is required please refer to our DHPS half pipes with 2 incorporated sealings.

For verification of the splash water tightness we performed several pressure tests with pressure tightness results of up to 0,3 bar for the lock section, but this value is depending on half pipe size and also might not be reached for every half pipe due to the necessary production tolerances. So PESTEC can not confirm any tightness value for DHP half pipes.
